
POP2 ASD Proposal

Release 0.0.1

Ben Johnson

Jun 26, 2023

DERECHO

1	User Guide	3
1.1	Logging on to the system	3
1.2	Queues	3
1.3	MPI Job Example	3
2	Accelerated Scientific Discovery	5
2.1	Overview	5
2.2	Proposal document	5
3	Compiling	9
4	Setup	11
4.1	Combining the obs_seq files into 5-day's worth of observations	11
5	Default CESM Grids	13
5.1	Low-resolution, eddy parameterizing	13
5.2	High-resolution, eddy resolving	16
6	Defining a custom grid	19
6.1	Available SCRIP grid files	19
6.2	Using f05_t12 as a starting point	20
6.3	Generate mapping files	21
6.4	Generate domain files	23
6.5	Edit config_grids.xml	23
6.6	Redo the process for f09_t12	25
6.7	Redo the process for f09_t13	26
6.8	Third attempt for f09_t13	28
7	Compsets	31
7.1	GIAF	31
7.2	GIAF_HR	31
7.3	GIAF_JRA	32
7.4	GIAF_JRA_HR	32
8	Generating the initial ensemble	33
8.1	Finding an initial set of restart files	33
8.2	Copy files into an ensemble	33
8.3	t12 restart files	34

9.1	CESM 2.1.0	35

9.2	CESM 2.1.1	35
9.3	Working attempts for t13	37
9.4	CESM 2.1.3	38
10	Modified buildnml script	39
11	Building the case	41
11.1	f09_g17	41
11.2	f09_t13	42
12	Build error in CESM2.1.3	45
13	Processor element layouts	47
13.1	Initial attempt	48
14	Configuration of CIME XML files	49
14.1	config_compilers.xml	49
14.2	config_machines.xml	49
14.3	config_batch.xml	52
15	Precursor projects	53
15.1	Adaptive inflation	53
15.2	Sea surface salinity	53
16	Creating runs for get_close caching tests	55
16.1	Restart files for the initial ensemble	55
16.2	Modified CESM installation	55
16.3	Repository containing setup scripts	56

This documents our DART+POP2 data assimilation ASD Project.

1.1 Logging on to the system

```
ssh $USER@derecho.hpc.ucar.edu
```

1.2 Queues

Ben Kirk posted to Slack to use the following command to test queue access:

```
qcmd -l select=2:ncpus=128:mpiprocs=128:mem=200G -A A##### -l walltime=0:05:00 --  
↪ "date && hostname"  
Waiting on job launch; 1230726.desched1 with qsub arguments:  
  qsub -l select=2:ncpus=128:mpiprocs=128:mem=200G -A A##### -q main@desched1 -l  
↪ walltime=0:05:00  
  
Thu 15 Jun 2023 10:45:21 PM MDT  
dec0476
```

This command gives an overview of the queues:

```
qstat -Qf
```

1.3 MPI Job Example

```
#!/bin/bash  
#PBS -A project_code  
#PBS -N mpi_job  
#PBS -q main  
#PBS -l walltime=01:00:00  
#PBS -l select=2:ncpus=128:mpiprocs=128  
  
# load necessary module environment  
module purge  
module load ncarenv craype cce cray-mpich
```

(continues on next page)

(continued from previous page)

```
# Run application using cray-mpich MPI  
mpiexec -n 256 -ppn 128 ./executable_name
```

ACCELERATED SCIENTIFIC DISCOVERY

2.1 Overview

Note: This project has cleared this initial proposal stage and the final proposal is due prior to January 10, 2022.

According to the full proposal request:

Your full proposal should follow the guidelines provided for University ASD proposals at <https://www2.cisl.ucar.edu/university-asd>. This will be similar to the normal NSC proposal format, with additional attention to project readiness, team commitment, and your analysis and data management plan. You may omit discussion of strategic relevance since that has been assessed in Phases 1 and 2.

Note that your full proposal should be completed and submitted via the [allocation submission site](#).

<p>Warning: The CISL “University ASD” link above was broken when the new CISL website was unveiled in December 2021. The guidelines from that now-lost page are reproduced below.</p>
--

2.2 Proposal document

Proposals should be five pages or less for Sections A–E below. The data management plan, accomplishment reports, references, and figures (Sections F–I) should be an additional five pages or less. The proposal should address each numbered item; please retain the section and item numbering and order in your responses.

Note: The request document must identify all PIs and Co-Is on any associated awards. In addition, the web submission form must include the names and affiliations of all PIs and Co-Is on the supporting NSF grant(s) and a complete list of collaborators and their institutions.

2.2.1 A. Project title and PIs

On the first page of the ASD proposal document please include the following:

ASD project title PIs and Co-Is on the supporting NSF award(s) along with their institution CPU core-hours and/or GPU hours requested Peak disk space needed

2.2.2 B. Scientific objectives

Describe the scientific problem that will be studied and its importance. This section should include discussion of related work recently completed by the PIs and other scientists along with supporting references; describe the linkage between the NSF award(s) and the proposed ASD activity (especially important if the published NSF award abstract does not clearly describe the computational component of the work funded or if the work is a “natural extension” of the funded work).

2.2.3 C. Computational plan

Discussion of your planned computational experiments and the resources needed should comprise the bulk of the five-page proposal.

Describe the numerical approach or models to be used. (For a non-standard or non-community model, the numerical description should briefly describe the approximations and other methods proposed to obtain valid solutions to the problem.)

Describe the computational experiments being proposed and how they relate to the scientific objectives in sufficient detail for reviewers to confirm the estimate of system resources required.

Describe the number of CPU core-hours and/or GPU hours required for each proposed experiment and the total resources for the request, including the total data written to disk, sufficient for reviewers to assess the appropriateness and efficiency of the data management plan. Explain how the number of core-hours per simulated year was determined.

Provide a table summarizing the number of CPU core-hours, GPU hours, and storage space required for each experimental configuration and the total for the proposed set of computational experiments.

2.2.4 D. Code requirements and readiness

The reviewers will use this section to assess the readiness of the code to run successfully and efficiently as soon as Derecho becomes available.

Describe the model or code to be used in a few sentences, including an assessment of its current readiness to run on Derecho. Please include the name of the model or code. You may cite a web page where the model or code is described.

Describe your proposed project’s special programming or runtime environment requirements. For example, required software, libraries, wall-clock time, scratch disk space needs, particularly if they differ significantly from what is currently available by default on Cheyenne today.

Benchmarks and scalability

Benchmarking system and results: Please summarize benchmark details or reference web page. Describe the model or code’s scalability on current systems and estimate the maximum number of Derecho nodes that could be used efficiently.

Other special requirements

2.2.5 E. Data analysis and visualization

ASD projects may be granted allocations on the Casper cluster in addition to Derecho allocations. CISL will provide help in constructing visualizations to improve understanding and presentation of results. Please describe plans or estimated needs for data analysis and visualization resources following the ASD project period on Derecho.

Supporting information

Sections F–I together should be an additional five pages or less.

2.2.6 F. Data management plan

Because of the potential for large-scale Derecho projects to produce extensive data output, the project’s short-term disk storage needs and the ASD project data targeted for longer-term storage should be described in Section C. The Data Management Plan should be used to provide additional explanation of the project’s data needs and plans.

Disk space

Describe the project’s medium-term disk needs for data analysis and visualization following completion of the primary HPC runs through the submission of the final report in March 2023.

Storage space

NCAR will provide storage space, commensurate with review panel recommendations, for up to one year after the ASD project ends. Describe any longer-term storage needs and/or relevant plans for sharing or managing the resulting data over the longer term.

Offsite data transfer

Discuss the amount of data to be transferred to another center and the frequency of transfers.

2.2.7 G. Accomplishment report on prior large allocations

The reviewers will use the accomplishment report to judge the proposing team’s experience with large-scale computations and their likelihood of ASD success on Derecho. The accomplishment report should focus on research in the past five years conducted with large (merit-reviewed) computing allocations at NCAR or other HPC centers. In addition to summarizing the computational experiments and scientific outcomes, the accomplishment report should note

- (a) the scientific publications produced,
- (b) the number of graduate students that worked on each large allocation project,
- (c) the theses produced, if any.

2.2.8 H. References

Please limit references to those directly related to the proposed project.

2.2.9 I. Figures and captions

Optional. Figures may be embedded within the first five pages of the proposal document; however, embedded figures will count against the five-page limit.

COMPILING

For the ASD project, DART will be compiled with the PrgEnv-gnu programming environment and compilers recommended by HPE/Cray.

During the NERSC December 2021 GPU Hackathon, Johnson, along with DAREs Software Engineer Helen Kershaw and ASP Post-doc Chris Riedel, ported DART code to the Department of Energy's Perlmutter machine, which is a Cray EX supercomputer (Derecho is also a Cray EX). Under the guidance of three development engineers from Nvidia, the team GPU-accelerated a kernel of DART's source code using Nvidia's nvfortran compiler and OpenACC directives. The code was accelerated by a factor of 15x using pinned memory, but the computed results were incorrect (there is a possible "off by one" bug in the compiler). Thus this project does not plan to use the PrgEnv-nvidia compilers.

4.1 Combining the obs_seq files into 5-day's worth of observations

This python script process the WOD13 files into files containing 5-day's worth of observations. It makes use of the f90nml packaged written by Marshall Ward.

The original file is on glade here: `/glade/work/johnsonb/git/DART_derecho/models/POP/work/obs_sequence_tool_to_5day.py`

```
#!/glade/apps/opt/modulefiles/idep python

from datetime import date, timedelta
import f90nml
import os

# To modify a namelist but preserve its comments and formatting, create a
# namelist patch and apply it to a target file using the patch function

start_year = 2010
start_month = 1
start_day = 1

obs_seq_path = '/glade/p/cisl/dares/Observations/WOD13/' # 200701/obs_seq.0Z.20070101
output_path = '/glade/derecho/scratch/johnsonb/obs_seq/'
start_date = date(start_year, start_month, start_day)
timedeltas = [timedelta(days=increment) for increment in range(0, 5)]

while start_date.year != 2017:

    # Get the list of dates in this 5-day window
    list_of_dates = [start_date + this_timedelta for this_timedelta in timedeltas]

    # Write the input files to the text file that will be read by obs_sequence_tool
    with open('./obs_sequence_tool_list.txt', 'w') as f:

        for this_date in list_of_dates:
            line = obs_seq_path + str(this_date.year).zfill(4) + str(this_date.month).
            ↪zfill(2) + '/obs_seq.0Z.' + str(this_date.year).zfill(4) + str(this_date.month).
            ↪zfill(2) + str(this_date.day).zfill(2)
            f.write(line + '\n')
```

(continues on next page)

(continued from previous page)

```
print(line)

# Edit input.nml to set the output file
filename_out = output_path + 'obs_seq.0Z.' + str(list_of_dates[0].year).zfill(4) +
↳str(list_of_dates[0].month).zfill(2) + str(list_of_dates[0].day).zfill(2) + '_' +
↳str(list_of_dates[-1].year).zfill(4) + str(list_of_dates[-1].month).zfill(2) +
↳str(list_of_dates[-1].day).zfill(2)
print('filename_out:', filename_out)

# Patch input.nml
patch_nml = {'obs_sequence_tool_nml': {'filename_out': filename_out}}
f90nml.patch('./input.nml', patch_nml, './temp_input.nml')
os.rename('./temp_input.nml', './input.nml')

# Run obs_sequence_tool
os.system('./obs_sequence_tool')

# Increment to the next start date
start_date = list_of_dates[-1] + timedelta(days=1)
```

DEFAULT CESM GRIDS

The project compares the behavior of POP2 ensembles using two different grid configurations: a low-resolution, eddy-parameterizing grid and a high-resolution, eddy-resolving grid.

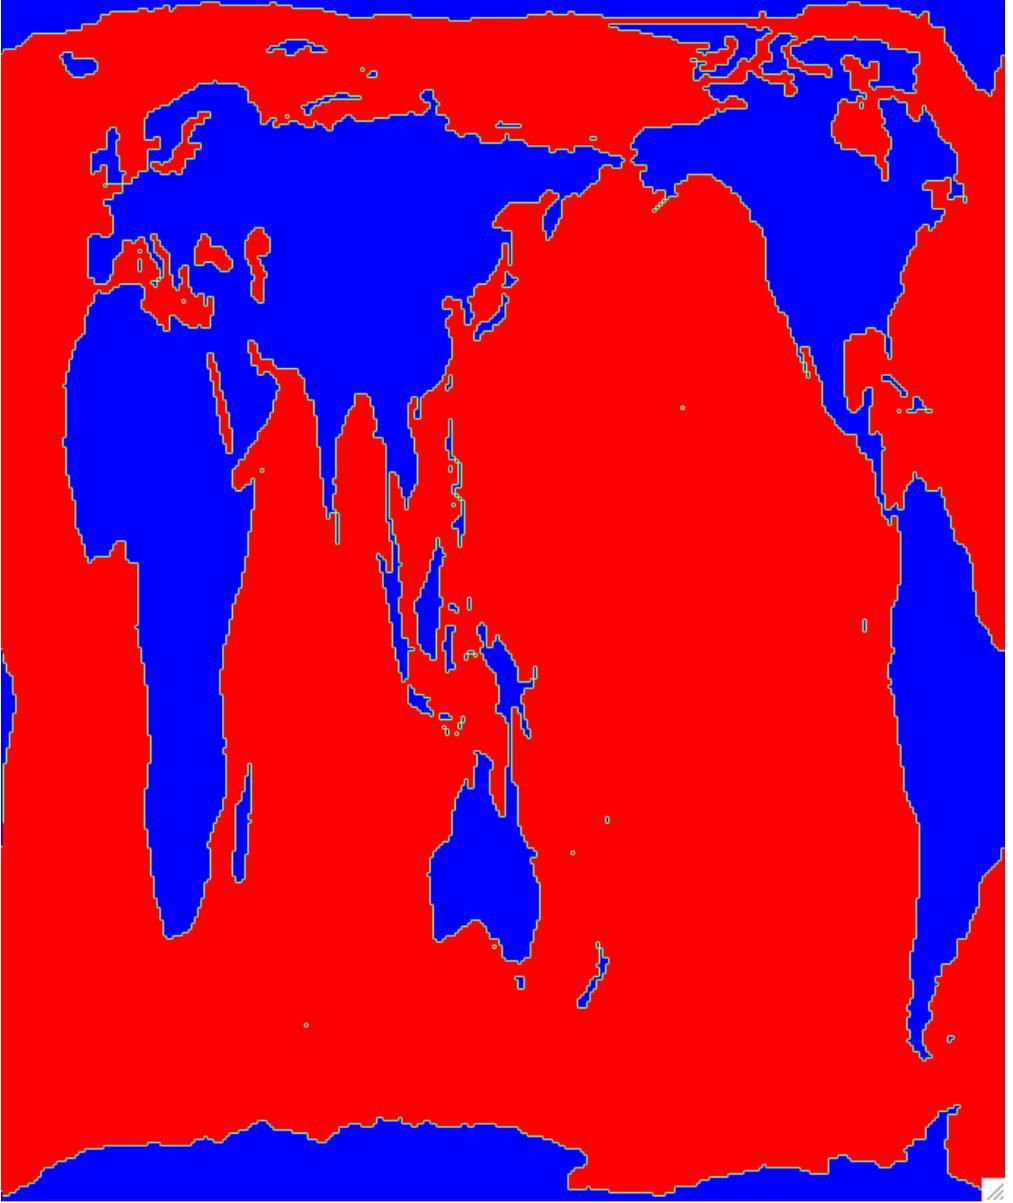

The default available atmospheric grids for each are listed on the [CESM Grid Resolution Definitions](#) and are reproduced below.

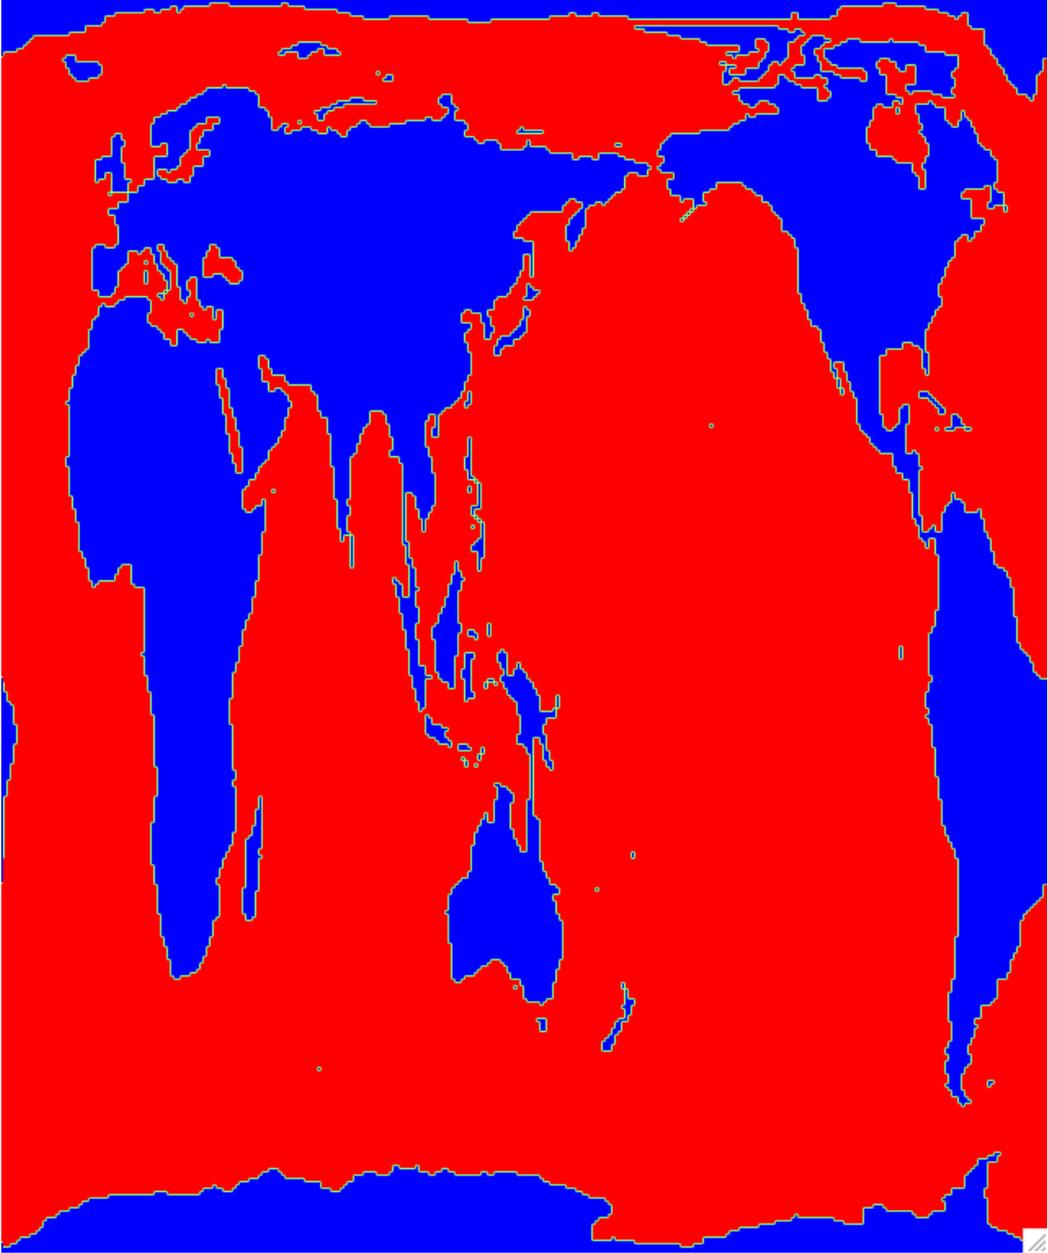

5.1 Low-resolution, eddy parameterizing

The CESM grid used for the Coupled Model Intercomparison Project (CMIP) is a 1° grid with a displaced Greenland pole. It has two configurations within CESM: g16 and g17.

This is the same ocean/ice grid used for the [CESM large ensemble](#) and the [DART CAM6 Reanalysis](#).

Each of these grids has been coupled to different atmospheric and land grids, which are listed in the *Default configurations* table rows below.

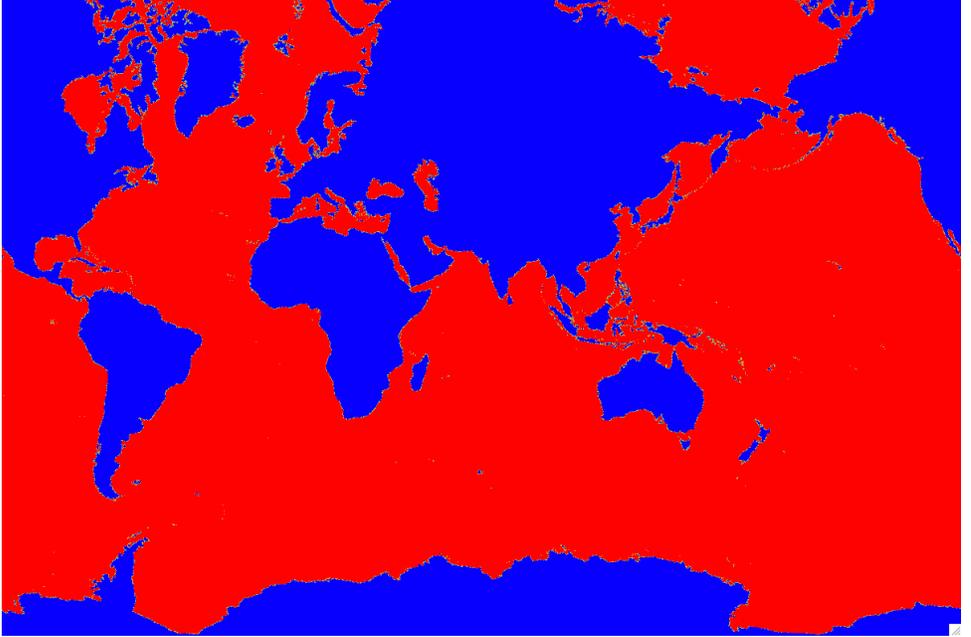

Grid	g16
Grid type	gx1v6 is displaced Greenland pole v6 1-deg grid
Domain file	/glade/p/cesm/cseg/inputdata/share/domains/domain.ocn.gx1v6.090206.nc
Domain	
Default configurations	f02_g16, f05_g16, f09_g16, f19_g16, ne120_g16, ne240_f02_g16, ne30_f09_g16, ne30_f19_g16, ne30_g16, ne60_g16, T62_g16

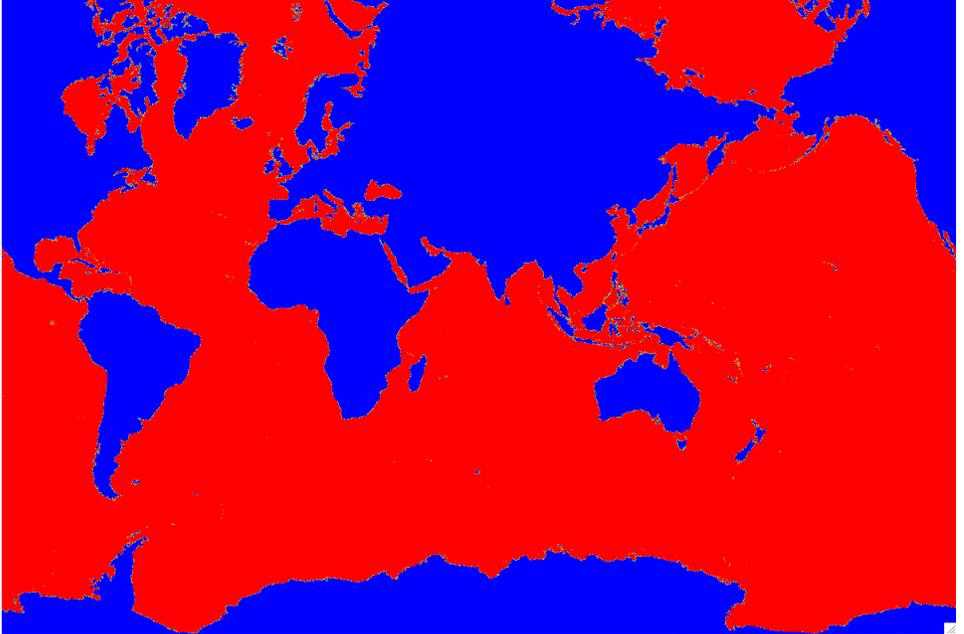

Grid	g17
Grid type	gx1v7 is displaced Greenland pole 1-deg grid with Caspian as a land feature
Domain file	/glade/p/cesm/cseg/inputdata/share/domains/domain.ocn.gx1v7.151008.nc
Domain	
Default configurations	f02_g17, f05_g17, f09_g17, f19_g17, f19_g17_r01, f19_g17_r05, g17_g17, ne0CONUSne30x8_g17, ne120_g17, ne120pg3_g17, ne16_g17, ne240_f02_g17, ne30_f09_g17, ne30_f19_g17, ne30_g17, ne30pg3_g17, ne60_g17, T62_g17, TL319_g17, TL639_g17

5.2 High-resolution, eddy resolving

The $\sim 0.1^\circ$ ocean/sea ice grid has two different configurations within CESM: $t12$ and $t13$. Each of these grids has been coupled to different atmospheric and land grids. This is the same ocean/ice grid used in Johnson et al. (2016) and Deppenmeier et al. (2021).

Each of these grids has been coupled to different atmospheric and land grids, which are listed in the *Default configurations* table rows below.

Grid	$t12$
Grid type	tx0.1v2 is tripole v2 1/10-deg grid
Domain file	/glade/p/cesm/cseg/inputdata/share/domains/domain.ocn.tx0.1v2.161014.nc
Domain	
Default configurations	f02_t12, f05_t12, ne120_t12, ne240_t12, T341_f02_t12, T62_t12

Grid	t13
Grid type	tx0.1v3 is tripole v3 1/10-deg grid with Caspian as a land feature
Domain file	/glade/p/cesm/cseg/inputdata/share/domains/domain.ocn.tx0.1v3.170730.nc
Domain	
Default Configurations	ne120pg3_t13, T62_t13, TL319_t13

DEFINING A CUSTOM GRID

In order to use the CAM6 reanalysis to force the t13 ocean/sea ice grid, a f09_t13 grid needs to be defined within CIME.

The [Model grids](#) page in the CIME documentation provides instructions for doing so.

6.1 Available SCRIP grid files

CIME doesn't provide functionality to create Spherical Coordinate Remapping and Interpolation Package (SCRIP) since it is a Los Alamos product (Jones, 1999).

SCRIP files are the input files for the mapping utility, as described in Step 1 of [Adding grids](#). But, there should be SCRIP files for f09 and t13 already on GLADE since those grids are already part of CESM. Let's start searching.

```
vi /glade/p/cesm/cseg/mapping/grids/README
(2021-06-23)
Old files here have been moved to the inputdata directory:
inputdata/share/scripgrids
Moving forward, all important scrip grid files (e.g., those that relate to
standard CESM model resolutions) should be put in that directory and checked
in to the inputdata repository. (ESMF mesh files should be put in
inputdata/share/meshes.)
```

6.1.1 f09

The f09 scrip grids files are here:

```
/glade/p/cesm/cseg/inputdata/share/scripgrids/0.9x1.25_EW_SCRIP_desc.181018.nc
/glade/p/cesm/cseg/inputdata/share/scripgrids/0.9x1.25_NS_SCRIP_desc.181018.nc
/glade/p/cesm/cseg/inputdata/share/scripgrids/0.9x1.25_SCRIP_desc.181018.nc
```

6.1.2 t13

The t13 scrip grid files are here:

```
/glade/p/cesm/cseg/inputdata/share/scripgrids/tx0.1v3_211102.nc
```

6.2 Using f05_t12 as a starting point

The most similar existing grid combination to the f09_t13 grid that we are attempting to create is the f05_t12 grid. In `/glade/work/johnsonb/cesm2_1_3/cime/config/cesm/config_grids.xml`, there are two relevant sections regarding f05_T12:

```
<!-- Line 375 -->
<model_grid alias="f05_t12">
  <grid name="atm">0.47x0.63</grid>
  <grid name="lnd">0.47x0.63</grid>
  <grid name="ocnice">tx0.1v2</grid>
  <mask>tx0.1v2</mask>
</model_grid>

<!-- Line 1586 -->
<gridmap atm_grid="0.47x0.63" ocn_grid="tx0.1v2">
  <map name="ATM2OCN_FMAPNAME">cpl/cpl6/map_fv0.47x0.63_to_tx0.1v2_aave_da_090218.nc</
  ↪map>
  <map name="ATM2OCN_SMAPNAME">cpl/cpl6/map_fv0.47x0.63_to_tx0.1v2_bilin_da_090218.nc</
  ↪map>
  <map name="ATM2OCN_VMAPNAME">cpl/cpl6/map_fv0.47x0.63_to_tx0.1v2_bilin_da_090218.nc</
  ↪map>
  <map name="OCN2ATM_FMAPNAME">cpl/cpl6/map_tx0.1v2_to_fv0.47x0.63_aave_da_090218.nc</
  ↪map>
  <map name="OCN2ATM_SMAPNAME">cpl/cpl6/map_tx0.1v2_to_fv0.47x0.63_aave_da_090218.nc</
  ↪map>
</gridmap>
```

It appears that we might *not* want patch mapping because the only ocean grids that have patch mapping in `config_grids.xml` are these two gx1v6 and gx3v7 grid (out of scores of other grid configurations).

```
<!-- Line 1578 -->
<gridmap atm_grid="0.47x0.63" ocn_grid="gx1v6">
<!-- Line 1833 -->
<gridmap atm_grid="T31" ocn_grid="gx3v7">
```

6.2.1 Interesting note: no domain file

There is no domain entry defined for the f05_t12 grid:

```
<!-- Line 1119 -->
<domain name="0.47x0.63">
  <nx>576</nx> <ny>384</ny>
  <file grid="atm|lnd" mask="gx1v6">domain.lnd.fv0.47x0.63_gx1v6_090407.nc</file>
  <file grid="ocnice" mask="gx1v6">domain.ocn.0.47x0.63_gx1v6_090408.nc</file>
  <file grid="atm|lnd" mask="gx1v7">domain.lnd.fv0.47x0.63_gx1v7.180521.nc</file>
  <file grid="ocnice" mask="gx1v7">domain.ocn.fv0.47x0.63_gx1v7.180521.nc</file>
  <desc>0.47x0.63 is FV 1/2-deg grid:</desc>
</domain>
```

6.3 Generate mapping files

Mapping files should be generated for:

```
atm <-> ocn
atm <-> wav
lnd <-> rof
lnd <-> glc
ocn <-> wav
rof -> ocn
```

by calling `gen_cesm_maps.sh` in `$CIMEROOT/tools/mapping/gen_mapping_files/`.

6.3.1 Build the executable

The initial step is to build the `ESMF_RegridWeightGenCheck` executable.

```
module load esmf_libs/8.0.0
module load esmf-8.0.0-ncdfio-uni-0
make
ls -lart ../
[ ... ]
drwxr-xr-x 3 johnsonb ncar 4096 Jan 4 06:58 .
-rwxr-xr-x 1 johnsonb ncar 1624728 Jan 4 06:58 ESMF_RegridWeightGenCheck
```

6.3.2 Run the script

The next step is to run the `gen_cesm_maps.sh` script with the appropriate options:

```
cd /glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_mapping_files
qsub -I -l select=1:ncpus=36:mpiprocs=36 -l walltime=01:00:00 -q regular -A P86850054
./gen_cesm_maps.sh \
--fileocn /glade/p/cesm/cseg/inputdata/share/scripgrids/tx0.1v3_211102.nc \
--nameocn tx0.1v3 \
--fileatm /glade/p/cesm/cseg/inputdata/share/scripgrids/0.9x1.25_SCRIP_desc.181018.nc \
```

(continues on next page)

(continued from previous page)

```
--nameatm fv0.9x1.25
[ ... ]
Tue Jan  4 13:34:36 MST 2022
1: map_tx0.1v3_TO_fv0.9x1.25_aave.220104.nc
All          21 tests passed!
-----
2: map_tx0.1v3_TO_fv0.9x1.25_blin.220104.nc
All          14 tests passed!
-----
3: map_fv0.9x1.25_TO_tx0.1v3_aave.220104.nc
All          21 tests passed!
-----
4: map_fv0.9x1.25_TO_tx0.1v3_blin.220104.nc
All          14 tests passed!
-----
5: map_fv0.9x1.25_TO_tx0.1v3_patc.220104.nc
All          14 tests passed!
-----
```

So it appears the mapping files were created properly.

6.3.3 Resultant files

The script creates two sets of files in `/glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_mapping_files`

Mapping ocean to atmosphere

- Conservative, area-averaged: `map_tx0.1v3_TO_fv0.9x1.25_aave.220104.nc`
- Non-conservative, bilinear: `map_tx0.1v3_TO_fv0.9x1.25_blin.220104.nc`

Mapping atmosphere to ocean

- Conservative, area-averaged: `map_fv0.9x1.25_TO_tx0.1v3_aave.220104.nc`
- Non-conservative, bilinear: `map_fv0.9x1.25_TO_tx0.1v3_blin.220104.nc`
- Non-conservative, patch: `map_fv0.9x1.25_TO_tx0.1v3_patc.220104.nc`

Caution: Before the actual experiment begins, check to see if a new `rtm->ocn` mapping file must be created. The [Adding grids](#) section of the CIME documentation says that the, “process for mapping from the runoff grid to the ocean grid is currently undergoing many changes. . . please contact Michael Levy for assistance.”

6.4 Generate domain files

6.4.1 Build the executable

```
cd /glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_domain_files
more INSTALL
# Read the installation instructions
cd src
../../../../configure --macros-format Makefile --mpilib mpi-serial
(. ./env_mach_specific.sh ; gmake)
ls -lart ../
[ ... ]
drwxr-xr-x 3 johnsonb ncar 4096 Jan 4 14:52 .
-rwxr-xr-x 1 johnsonb ncar 6086848 Jan 4 14:52 gen_domain
```

6.4.2 Pass the executable the correct files

```
cd /glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_domain_files
./gen_domain -m ../gen_mapping_files/map_tx0.1v3_TO_fv0.9x1.25_aave.220104.nc -o tx0.1v3_
↪-l fv0.9x1.25
[ ... ]
write domain.lnd.fv0.9x1.25_tx0.1v3.220104.nc
successfully created domain file domain.lnd.fv0.9x1.25_tx0.1v3.220104.nc
write domain.ocn.fv0.9x1.25_tx0.1v3.220104.nc
successfully created domain file domain.ocn.fv0.9x1.25_tx0.1v3.220104.nc
```

6.5 Edit config_grids.xml

Next edit config_grids.xml to add a model_grid node, a gridmap node and possibly a domain entry for every new component grid.

6.5.1 Define the model grid

```
<!-- New f09_t13 grid for DART+POP2 ASD Project -->
<model_grid alias="f09_t13">
  <grid name="atm">0.9x1.25</grid>
  <grid name="lnd">0.9x1.25</grid>
  <grid name="ocnice">tx0.1v3</grid>
  <mask>tx0.1v3</mask>
</model_grid>
```

6.5.2 Add the domain files

```

<!-- Line 1128 -->
<domain name="0.9x1.25">
  <nx>288</nx> <ny>192</ny>
  <file grid="atm|lnd" mask="gx1v6">domain.lnd.fv0.9x1.25_gx1v6.090309.nc</file>
  <file grid="ocnice" mask="gx1v6">domain.ocn.0.9x1.25_gx1v6_090403.nc</file>
  <file grid="atm|lnd" mask="gx1v7">domain.lnd.fv0.9x1.25_gx1v7.151020.nc</file>
  <file grid="ocnice" mask="gx1v7">domain.ocn.fv0.9x1.25_gx1v7.151020.nc</file>
  <file grid="atm|lnd" mask="tn1v3">domain.lnd.fv0.9x1.25_tn1v3.160414.nc</file>
  <file grid="ocnice" mask="tn1v3">domain.ocn.fv0.9x1.25_tn1v3.160414.nc</file>
  <file grid="atm|lnd" mask="tn0.25v3">domain.lnd.fv0.9x1.25_tn0.25v3.160721.nc</file>
  <file grid="ocnice" mask="tn0.25v3">domain.ocn.fv0.9x1.25_tn0.25v3.160721.nc</file>
  <file grid="atm|lnd" mask="null">/glade/u/home/benedict/ys/datain/domain.aqua.fv0.9x1.
↪25.nc</file>
  <file grid="ocnice" mask="null">/glade/u/home/benedict/ys/datain/domain.aqua.fv0.9x1.
↪25.nc</file>
  <!-- New f09_t13 domains for DART+POP2 ASD Project -->
  <file grid="atm|lnd" mask="tx0.1v3">/glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/
↪gen_domain_files/domain.lnd.fv0.9x1.25_tx0.1v3.220104.nc</file>
  <file grid="ocnice" mask="tx0.1v3">/glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/
↪gen_domain_files/domain.ocn.fv0.9x1.25_tx0.1v3.220104.nc</file>
  <desc>0.9x1.25 is FV 1-deg grid:</desc>
</domain>

```

6.5.3 Declare the grid maps

```

<!-- New f09_t13 gridmap for DART+POP2 ASD Project -->
<gridmap atm_grid="0.9x1.25" ocn_grid="tx0.1v3">
  <map name="ATM2OCN_FMAPNAME">/glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_
↪mapping_files/map_fv0.9x1.25_TO_tx0.1v3_aave.220104.nc</map>
  <map name="ATM2OCN_SMAPNAME">/glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_
↪mapping_files/map_fv0.9x1.25_TO_tx0.1v3_blin.220104.nc</map>
  <map name="ATM2OCN_VMAPNAME">/glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_
↪mapping_files/map_fv0.9x1.25_TO_tx0.1v3_blin.220104.nc</map>
  <map name="OCN2ATM_FMAPNAME">/glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_
↪mapping_files/map_tx0.1v3_TO_fv0.9x1.25_aave.220104.nc</map>
  <map name="OCN2ATM_SMAPNAME">/glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_
↪mapping_files/map_tx0.1v3_TO_fv0.9x1.25_aave.220104.nc</map>
</gridmap>

```

6.5.4 Check the XML file

Check the formatting of the XML file to ensure it is formatted properly:

```

cd /glade/work/johnsonb/cesm2_1_3/cime/config/cesm
xmllint --noout --schema /glade/work/johnsonb/cesm2_1_3/cime/config/xml_schemas/config_
↪grids_v2.xsd ./config_grids.xml
./config_grids.xml validates

```

6.6 Redo the process for f09_t12

6.6.1 Scrip grid files

f09

```
/glade/p/cesm/cseg/inputdata/share/scripgrids/0.9x1.25_SCRIP_desc.181018.nc
```

t12

```
/glade/p/cesm/cseg/inputdata/share/scripgrids/tx0.1v2_211102.nc
```

```
cd /glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_mapping_files
qsub -I -l select=1:ncpus=36:mpiprocs=36 -l walltime=01:00:00 -q regular -A P86850054
./gen_cesm_maps.sh \

</gridmap>

```

6.7 Redo the process for f09_t13

There are two SCRIP grid files for t13:

```

/glade/p/cesm/cseg/inputdata/share/scripgrids/tx0.1v3_211102.nc
/glade/p/cesm/cseg/inputdata/share/scripgrids/tx0.1v3_170728.nc

```

The tx0.1v3_211102.nc file was used in the initial attempt. The runs resulting exhibited perplexing behavior suggesting that there was something wrong with the file. This attempt rebuilds the mapping and domain files with the tx0.1v3_170728.nc file.

6.7.1 Build ESMF_RegridWeightGenCheck

```
cd /glade/work/johnsonb/cesm2_1_1/cime/tools/mapping/check_maps/src
module load esmf_libs/8.0.0
module load esmf-8.0.0-ncdfio-uni-0
gmake
ls -lart ../
drwxr-xr-x 3 johnsonb ncar 4096 Jan 13 16:11 .
-rwxr-xr-x 1 johnsonb ncar 1624728 Jan 13 16:11 ESMF_RegridWeightGenCheck
```

6.7.2 Mapping files

```
cd /glade/work/johnsonb/cesm2_1_1/cime/tools/mapping/gen_mapping_files/
qsub -I -l select=1:ncpus=36:mpiprocs=36 -l walltime=01:00:00 -q regular -A P86850054
./gen_cesm_maps.sh \

↪mapping_files/map_tx0.1v3_TO_fv0.9x1.25_aave.220113.nc</map>
</gridmap>

```

Note: As described in *List of attempts*, this attempt worked.

6.8 Third attempt for f09_t13

The second attempt for f09_t13 works but after inspecting the header information for the f09_g16 and f09_g17 mapping and domain files, it seems that it would be prudent to use the exact same f09 Scrip grid file for f09_t13 as was used for the f09_g17 files.

6.8.1 Map files

Save the previous attempt

```

cd /glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_mapping_files
mkdir previous_attempt
mv *tx0.1v3* previous_attempt

```

Make a second attempt

```

cd /glade/work/johnsonb/cesm2_1_3/cime/tools/mapping/gen_mapping_files/
qsub -I -l select=1:ncpus=36:mpiprocs=36 -l walltime=01:00:00 -q regular -A P86850054

COMPSETS

When defining non-default compsets, it is advisable to start with a default compset and adapt it.

The CESM [Component Set Definitions](#) page lists all of the defined compsets.

In this case, there are two pairs of compsets whose configuration can be studied as a starting point: the COREv2 forcing of [Large and Yeager \(2009\)](#), which corresponds to the GIAF and GIAF_HR compsets in CESM, and the JRA-55 forcing of [Kobayashi et al. \(2015\)](#), which corresponds to the GIAF_JRA and GIAF_JRA_HR compsets.

- In **all** compsets, the land ice component is stub glacier.
- In **eddy-parameterizing** compsets, the wave component is Wave Watch 3.
- In **eddy-resolving** compsets, the wave component is stub wave.

7.1 GIAF

Long name: 2000_DATM%IAF_SLND_CICE_POP2_DROF%IAF_SGLC_WW3

	Value	Description
Initialization Time	2000	1850: Pre-Industrial; 2000 present day: Additional initialization times defined by components.
Atmosphere	DATM%IAF	Data driven ATM COREv2 interannual forcing
Land	SLND	Stub land component
Sea-Ice	CICE	Sea ICE (cice) model version 5
Ocean	POP2	POP2
River runoff	DROF%IAF	Data runoff modelCOREv2 interannual year forcing:
Land Ice	SGLC	Stub glacier (land ice) component
Wave	WW3	Wave Watch

7.2 GIAF_HR

Long name: 2000_DATM%IAF_SLND_CICE_POP2_DROF%IAF_SGLC_SWAV

	Value	Description
Initialization Time	2000	1850: Pre-Industrial; 2000 present day: Additional initialization times defined by components.
Atmosphere	DATM%IAF	Data driven ATM COREv2 interannual forcing
Land	SLND	Stub land component
Sea-Ice	CICE	Sea ICE (cice) model version 5
Ocean	POP2	POP2
River runoff	DROF%IAF	Data runoff modelCOREv2 interannual year forcing:
Land Ice	SGLC	Stub glacier (land ice) component
Wave	SWAV	Stub wave component

7.3 GIAF_JRA

Long name: 2000_DATM%JRA-1p4-2018_SLND_CICE_POP2_DROF%JRA-1p4-2018_SGLC_WW3

	Value	Description
Initialization Time	2000	1850: Pre-Industrial; 2000 present day: Additional initialization times defined by components.
Atmosphere	DATM%JRA-1p4-2018	Data driven ATM interannual JRA55 forcing, v1.4, through 2018
Land	SLND	Stub land component
Sea-Ice	CICE	Sea ICE (cice) model version 5
Ocean	POP2	POP2
River runoff	DROF%JRA-1p4-2018	Data runoff modelJRA55 interannual forcing, v1.4, through 2018
Land Ice	SGLC	Stub glacier (land ice) component
Wave	WW3	Wave Watch

7.4 GIAF_JRA_HR

Long name: 2000_DATM%JRA-1p4-2018_SLND_CICE%CICE4_POP2_DROF%JRA-1p4-2018_SGLC_SWAV

	Value	Description
Initialization Time	2000	1850: Pre-Industrial; 2000 present day: Additional initialization times defined by components.
Atmosphere	DATM%JRA-1p4-2018	Data driven ATM interannual JRA55 forcing, v1.4, through 2018
Land	SLND	Stub land component
Sea-Ice	CICE%CICE4	Sea ICE (cice) model version 5 :running with cice4 physics
Ocean	POP2	POP2
River runoff	DROF%JRA-1p4-2018	Data runoff modelJRA55 interannual forcing, v1.4, through 2018
Land Ice	SGLC	Stub glacier (land ice) component
Wave	SWAV	Stub wave component

GENERATING THE INITIAL ENSEMBLE

For the benchmarking tests, the initial ensemble does not need the spread necessary to prevent filter divergence.

8.1 Finding an initial set of restart files

Since HPSS is offline, it's unclear where the restart files are from [Johnson et al. \(2016\)](#). But (luckily) it's easier to find restart files on campaign storage than it was on HPSS.

```
sftp data-access.ucar.edu
cd /gpfs/csfs1/cgd/oce
find . -name "*t13*"
```

8.2 Copy files into an ensemble

Run a script to copy eighty sets of restart files into a restart directory on scratch.

```
cd /glade/u/home/johnsonb/pyscripts
python copy_restart_files.py
ls -lart /glade/scratch/johnsonb/g.e20.G.TL319_t13.control.001/rest/0001-01-01-00000
[ ... ]
-rw-r--r-- 1 johnsonb ncar 11335683072 Jan  6 17:23 g.e20.G.TL319_t13.control.001.cice_
↪0079.r.0001-01-01-00000.nc
-rw-r--r-- 1 johnsonb ncar  8626923008 Jan  6 17:23 g.e20.G.TL319_t13.control.001.cpl_
↪0079.r.0001-01-01-00000.nc
-rw-r--r-- 1 johnsonb ncar 35251207680 Jan  6 17:23 g.e20.G.TL319_t13.control.001.pop_
↪0079.r.0001-01-01-00000.nc
-rw-r--r-- 1 johnsonb ncar 11335683072 Jan  6 17:23 g.e20.G.TL319_t13.control.001.cice_

```

8.3 t12 restart files

These are actually from Frank's Yellowstone ASD experiment:

```
cp g.e12.G.T62_t12.003.pop.r.0006-02-01-00000.nc /glade/scratch/johnsonb/g.e12.G.T62_t12.
→003/rest/0006-02-01-00000/g.e12.G.T62_t12.003.pop_0001.r.0006-02-01-00000.nc
cp g.e12.G.T62_t12.003.cice.r.0006-02-01-00000.nc /glade/scratch/johnsonb/g.e12.G.T62_
→t12.003/rest/0006-02-01-00000/g.e12.G.T62_t12.003.cice_0001.r.0006-02-01-00000.nc
cp g.e12.G.T62_t12.003.cpl.r.0006-02-01-00000.nc /glade/scratch/johnsonb/g.e12.G.T62_t12.
→003/rest/0006-02-01-00000/g.e12.G.T62_t12.003.cpl_0001.r.0006-02-01-00000.nc
```

LIST OF ATTEMPTS

9.1 CESM 2.1.0

9.2 CESM 2.1.1

9.2.1 GIAF_HR.cesm2_1_1.T62_t13.001

Build

```
./create_newcase --case /glade/work/johnsonb/cesm_runs/GIAF_HR.cesm2_1_1.T62_t13.001 --  
→compset GIAF_HR --res T62_t13 --mach cheyenne --run-unsupported --project P86850054  
Compset longname is 2000_DATM%IAF_SLND_CICE_POP2_DROF%IAF_SGLC_SWAV  
cd /glade/work/johnsonb/cesm_runs/GIAF_HR.cesm2_1_1.T62_t13.001  
./xmlquery STOP_N  
STOP_N: 3
```

Result

```
Execution terminated Exit_status=0 resources_used.cput=00:00:14  
resources_used.mem=34468kb resources_used.ncpus=1 resources_used.vmem=64996kb re-  
sources_used.walltime=00:00:15
```

Note: Perplexingly, this runs to “completion” but a POP2 restart file is not produced.

9.2.2 GIAF_HR.cesm2_1_1.T62_t12.001

Build

```
./create_newcase --case /glade/work/johnsonb/cesm_runs/GIAF_HR.cesm2_1_1.T62_t12.001 --  
→compset GIAF_HR --res T62_t12 --mach cheyenne --run-unsupported --project P86850054  
Compset longname is 2000_DATM%IAF_SLND_CICE_POP2_DROF%IAF_SGLC_SWAV  
cd /glade/work/johnsonb/cesm_runs/GIAF_HR.cesm2_1_1.T62_t12.001  
./xmlquery STOP_N  
STOP_N: 3
```

Result

Execution terminated Exit_status=1 resources_used.cpubercent=98002 resources_used.cput=91:35:53 re-
sources_used.mem=679832624kb resources_used.ncpus=1044 resources_used.vmem=5449231040kb re-
sources_used.walltime=00:06:06

Error: Warning: Departure points out of bounds in remap [...] remap transport: bad departure points ERROR:
remap transport: bad departure points

Chris Riedel linked to the relevant page in the [CICE documentation](#) for this problem. Editing `user_nl_cice` fixes the problem.

```
cd $CASEROOT
vim user_nl_cice_00*
! Append this line to the end of the file
ndtd = 5
```

9.2.3 G.benchmarking.cesm2_1_1.f09_t12.001

Build

```
./create_newcase --case /glade/work/johnsonb/cesm_runs/G.benchmarking.cesm2_1_1.f09_t12.
↪001 --compset GIAF_HR --res f09_t12 --mach cheyenne --run-unsupported --project_
↪P86850054
cd /glade/work/johnsonb/cesm_runs/G.benchmarking.cesm2_1_1.f09_t12.001
./case.setup
qcmd -q share -l select=1 -A P86850054 -- ./case.build
[ ... ]
MODEL BUILD HAS FINISHED SUCCESSFULLY
./xmlchange STOP_N=3
./case.submit -M begin,end
```

Result

Execution terminated Exit_status=1 resources_used.cpubercent=95809 resources_used.cput=84:07:17 re-
sources_used.mem=676683064kb resources_used.ncpus=1044 resources_used.vmem=5449458968kb re-
sources_used.walltime=00:06:18

Error: Warning: Departure points out of bounds in remap [...] remap transport: bad departure points ERROR:
remap transport: bad departure points

Note: It's promising that the T62_t12 case and the f09_t12 both encounter the CFL-like error.

9.2.4 GIAF_HR.cesm2_1_1.f09_t13.002

Important: Since the G.benchmarking.cesm2_1_1.f09_t12.001 run hit the CFL-like error, it suggests that the problem with the f09_t13 setup has to do with the mapping and domain files. This GIAF_HR.cesm2_1_1.f09_t13.002 case rebuilds the mapping and domain files with a different SCRIP file: /glade/p/cesm/cseg/inputdata/share/scripgrids/tx0.1v3_170728.nc

Build

```
./create_newcase --case /glade/work/johnsonb/cesm_runs/GIAF_HR.cesm2_1_1.f09_t13.002 --
↪compset GIAF_HR --res f09_t13 --mach cheyenne --run-unsupported --project P86850054
cd /glade/work/johnsonb/cesm_runs/GIAF_HR.cesm2_1_1.f09_t13.002
./case.setup
qcmd -q share -l select=1 -A P86850054 -- ./case.build
[ ... ]
MODEL BUILD HAS FINISHED SUCCESSFULLY
./xmlchange STOP_N=3
./case.submit -M begin,end
```

Result

Execution terminated Exit_status=0 resources_used.cpubercent=295569 resources_used.cput=364:38:03 re-
resources_used.mem=1158844040kb resources_used.ncpus=3060 resources_used.vmem=7207103764kb re-
resources_used.walltime=00:08:27

Note: This run ran to completion and output a POP restart file. This suggests that the SCRIP file was the issue confounding earlier t13 runs.

9.3 Working attempts for t13

9.3.1 Five members

G.benchmarking.startup.cesm2_1_1.f09_t13_e5.003

9.3.2 Ten members

G.benchmarking.startup.cesm2_1_1.f09_t13_e10.004

9.3.3 Fifteen members

G.benchmarking.startup.cesm2_1_1.f09_t13_e15

9.4 CESM 2.1.3

MODIFIED BUILDNML SCRIPT

During the [DART+CAM6 Reanalysis](#), Kevin Raeder and Jeff Steward identified and fixed a bottleneck in one of the MCT build scripts:

```
/glade/work/raeder/Models/cesm2_1_relsd_m5.6/cime/src/drivers/mct/cime_config/buildnml
```

The script runs slowly for a multi-instance CESM case because it attempts to write multiple files simultaneously into directories that are locked.

This bottleneck is inevitable during the first submission of `case.run`, but it can be avoided on subsequent submissions.

```
cd /glade/work/johnsonb/cesm2_1_3/cime/src/drivers/mct/cime_config
git mv buildnml buildnml.old
cp /glade/work/raeder/Models/cesm2_1_relsd_m5.6/cime/src/drivers/mct/cime_config/
↪buildnml ./
```

BUILDING THE CASE

11.1 f09_g17

11.1.1 Single instance

```
cd /glade/work/johnsonb/cesm2_1_3/cime/scripts
./create_newcase --case /glade/work/johnsonb/cesm_runs/G.CAM6-Reanalysis.f09_g17.001 --

PROCESSOR ELEMENT LAYOUTS

As described in the *Building the case* page, the default processor element (PE) layout for an eighty-member CESM POP2 case on the f09_t13 grid requires 242,880 total cores and there are only 145,152 cores on Cheyenne.

In order to run the benchmarking tests, the ensemble must be squeezed onto fewer PEs.

The default PE layout is:

```
cd /glade/work/johnsonb/cesm_runs/G.CAM6-Reanalysis.f09_t13.001.e80
./xmlquery --partial PE
[ ... ]
Results in group mach_pes
  NTASKS_PER_INST: ['ATM:72', 'LND:72', 'ICE:828', 'OCN:2208', 'ROF:72', 'GLC:72',
↪ 'WAV:72', 'ESP:1']
  ROOTPE: ['CPL:0', 'ATM:0', 'LND:0', 'ICE:0', 'OCN:828', 'ROF:0', 'GLC:0', 'WAV:0',
↪ 'ESP:0']

Results in group mach_pes_last
  COSTPES_PER_NODE: 36
  COST_PES: 242892
  MAX_MPITASKS_PER_NODE: 36
  MAX_TASKS_PER_NODE: 36
  TOTALPES: 242880
[ ... ]
```

Two nodes (72 tasks) are set for each instance of:

- ATM, LND, ROF, GLC, and WAV

23 nodes (828 tasks) are set for each instance of:

- ICE

61 and 1/3 nodes are set for each instance of:

- OCN

13.1 Initial attempt

For an initial f09_t13 scale down, try the following nodes:

One node for each instance of:

- 1 node for ATM, LND, ROF, GLC, AND WAV

11 nodes for each instance of:

- ICE

30 nodes for each instance of:

- OCN

13.1.1 Working in DART_pop2-asd-project

The `setup_CESM_hybrid_ensemble.csh` script reads in `DART_params.csh`. Make t13 versions of each of these scripts:

```
cp DART_params.csh DART_params_t13.csh
cp setup_CESM_hybrid_ensemble.csh setup_CESM_hybrid_t13_ensemble.csh
vim setup_CESM_hybrid_t13_ensemble.csh
./setup_CESM_hybrid_t13_ensemble.csh
```

CONFIGURATION OF CIME XML FILES

PRECURSOR PROJECTS

CISL's Advanced Research Computing Division [announced that Derecho will be delayed until June 2022](#). This could provide lead time to pursue precursor projects (on a different platform such as KAUST's [Shaheen II](#)) to test various aspects of the experimental setup such as adaptive inflation and the influence of certain observations such as sea surface salinity.

15.1 Adaptive inflation

An experiment contrasting the behavior of the inverse-gamma adaptive inflation algorithm of [Gharamti \(2019\)](#) in eddy-parameterizing and eddy-resolving ocean models has not been attempted. Such an experiment would enable the team to test the ASD experimental configuration over short (model week to month) integration periods.

15.2 Sea surface salinity

[Deppenmeier et al. \(2021\)](#) studied the temperature structure of the Pacific Cold Tongue (PCT). The PCT is adjacent to the Eastern Tropical Pacific Fresh Pool, yet the influence of salinity on the structure of the PCT is poorly understood. A/B experiments, in which sea surface salinity is assimilated and not assimilated could be conducted to gauge its influence on the predicability of the PCT.

CREATING RUNS FOR GET_CLOSE CACHING TESTS

16.1 Restart files for the initial ensemble

I've already copied the necessary POP and CICE restart files to a directory on scratch:

```
/glade/scratch/johnsonb/g.e20.G.TL319_t13.control.001/rest/0001-01-01-00000
```

The setup scripts create the necessary POP input files that reference these restart files. If, at a later date, the files have been wiped from scratch, please let me know and I'll rerun the script that copies them from campaign storage:

```
/glade/u/home/johnsonb/pyscripts/copy_restart_files.py
```

The restart files are from one of Alper Altuntas's (who is a software engineer in CGD's Ocean Section) high-resolution POP runs and there is restricted access to the Ocean Sections' directory on campaign storage that the restart files are stored in.

16.2 Modified CESM installation

This project uses a custom grid within CESM that allows us to use the CAM6 + DART reanalysis to prescribe realistic temperature, precipitation/evaporation and momentum fluxes from the atmosphere to the ocean.

CESM provides many grid configurations. The reanalysis was computed on a $1^\circ \times 1^\circ$ grid in CAM which is denoted f09. POP's mesoscale eddy-resolving high-resolution grid, t13, isn't used very often because running ocean physics at such high-resolution is computationally intensive. So in order to use the CAM6 reanalysis and the high-resolution ocean grid together, I defined a custom grid configuration within CESM, f09_t13, to couple CAM and POP together.

This custom grid definition is stored in this xml file in this CESM repository:

```
/glade/work/johnsonb/cesm2_1_1/cime/config/cesm/config_grids.xml
```

If you are running tests on Cheyenne, the setup scripts are already set to reference this installation of CESM. If you are running the tests on another system, this entire cesm2_1_1 directory must be copied to that system.

16.3 Repository containing setup scripts

The relevant subdirectory of the DART repository containing the setup scripts is here:

```
/glade/work/johnsonb/git/DART_pop2-asd-project/models/POP/shell_scripts/cesm2_1
```

If you recursively copy this DART repository into the analogous subdirectory in your work directory on glade, `/glade/work/$USER/git/DART_pop2-asd-project` you won't need to modify the setup scripts.

Only two of the scripts are actually used:

1. `DART_params.csh`
2. `setup_CESM_startup_t13_ensemble.csh`

16.3.1 Using `DART_params.csh`

Again, if you recursively copied the DART repository, the scripts should work without modification. Otherwise, you'll likely need to change line 90 in `DART_params.csh`:

```
90 setenv DARTROOT /glade/work/${USER}/git/DART_pop2-asd-project
```

Ensure CESM SourceMods are present

In order to run POP with DART, specific source code files in POP's source code need to be overwritten. This modified source code:

1. Inserts flags into CESM that enable data assimilation within the model
2. Modifies one of the physics routines – the `barotropic mode solver` – to ensure that DART's filter increments don't crash the solver

The setup script will stage the modified source code for you. If it crashes, ensure the SourceMods are present where `DART_params.csh` expects them:

```
export cesmtag=cesm2_1_1
ls /glade/u/home/johnsonb/${cesmtag}/SourceMods
```

16.3.2 Using `setup_CESM_startup_t13_ensemble.csh`

Actually setting up the case should be as simple as:

```
./setup_CESM_startup_t13_ensemble.csh
```

Important: POP is a peculiar model within CESM. Historically, the initial files were binary rather than netCDF. So the setup script will configure CESM to run for two days, after which, you should run the `CESM_DART_config.csh` script that is placed into the case directory. It will configure the case to enable data assimilation.

After the setup script completes, you should get a success message such as:

```
[ ... ]
Time spent not building: 43.486701 sec
Time spent building: 1000.047169 sec
MODEL BUILD HAS FINISHED SUCCESSFULLY
```

Change directory to the case directory and submit the first (two model day) job.

```
cd $CASEROOT
./xmlquery STOP_N
  STOP_N: 2
./xmlquery STOP_OPTION
  STOP_OPTION: nday
./xmlquery --partial DATA_ASSIMILATION
  Results in group external_tools
    DATA_ASSIMILATION: ['CPL:FALSE', 'ATM:FALSE', 'LND:FALSE', 'ICE:FALSE',
↔ 'OCN:FALSE', 'ROF:FALSE', 'GLC:FALSE', 'WAV:FALSE']
    DATA_ASSIMILATION_CYCLES: 1
    DATA_ASSIMILATION_SCRIPT:
./case.submit -M begin,end
```

After that job completes, return to the case directory and run the `CESM_DART_config.csh` script. DART will complete an assimilation cycle when this run is submitted.

```
cd $CASEROOT
./CESM_DART_config.csh
./xmlchange STOP_N=1
./xmlquery STOP_N
  STOP_N: 1
./xmlquery --partial DATA_ASSIMILATION
  Results in group external_tools
    DATA_ASSIMILATION: ['CPL:FALSE', 'ATM:FALSE', 'LND:FALSE', 'ICE:FALSE', 'OCN:TRUE
↔ ', 'ROF:FALSE', 'GLC:FALSE', 'WAV:FALSE']
    DATA_ASSIMILATION_CYCLES: 1
    DATA_ASSIMILATION_SCRIPT: $CASEROOT/assimilate.csh
./case.submit -M begin,end
```
